

Morelord Craftworks

Module documentation reference

READMEs and user / GM documentation

September 7, 2026 | Local source snapshot

Local manifest version: **0.4.5**. This PDF collects the source documents listed below. Original manual version labels are preserved; older manuals may not cover newer README changes. This conversion does not establish current public release availability.

Included source	Document
morelord-craftworks/README.md	Morelord Craftworks
morelord-craftworks/USER-GUIDE.md	Morelord Craftworks User Guide
morelord-craftworks/docs/README.md	Morelord Craftworks Documentation
morelord-craftworks/docs/gm-manual.md	Morelord Craftworks Game Master Manual
morelord-craftworks/docs/player-manual.md	Morelord Craftworks Player Manual

Prepared in the visual style of the Campaign Manager Product Summary v1.4 and Product and Development Plan v1.0. Use PDF bookmarks to navigate sections.

Morelord Craftworks

Morelord Craftworks is a Foundry VTT module for gathering, harvesting, looting, materials, recipes, and crafting workflows.

Craftworks separates **content packs** from the core module so campaigns can enable only the material, recipe, harvesting, gathering, and loot content appropriate for that world.

Support baseline

- Foundry Virtual Tabletop v14
- D&D5e 5.3+
- Morelord Core for Morelord Gaming account access and premium entitlements
- `socket lib` for multiplayer acquisition sessions

Foundry v13 compatibility is intentionally out of scope.

Standard features

Current Standard functionality includes:

- GM-initiated Harvesting
- GM-initiated Gathering
- Encounter Loot
- Treasure Hoards
- Craftworks material Items stored in normal actor inventories
- searchable Materials browser
- searchable Recipes browser grouped by crafting category
- recipe workflow context (inventory/crafter) is presented in its own panel above browsing controls
- large Materials and Recipes catalogs use an explicit filter-and-search workflow rather than rendering every record
- browsers show total catalog size plus a live prospective result count, capped visually at 500+
- Recipe browser filters include Content Pack, Category, ingredient rarity, ingredient material tag, and current-inventory craftability
- `Only Show Craftable Recipes` evaluates requirements against the selected Using Actor Inventory
- changing a query filter hides stale results until Search is run again
- Using Crafter Actor is always visible and may differ from the selected inventory actor
- recipe reference details including tools, checks, normal/no-tool DCs, and crafting-hour requirements
- Craftworks-wide crafting attempts representing 2 hours of work each
- failed crafting checks consume time but do not consume recipe materials
- direct navigation between recipe ingredients/outputs and the Materials browser
- Foundry Item recipe outputs resolve their live Item name/icon from UUID and can open the Item sheet directly

- recipe inventory readiness
- selected-inventory awareness for required tool possession and tool proficiency
- Group/Party actors can supply recipe materials while a separate Character actor supplies tools, proficiency, and checks
- crafting progress belongs to the Crafter Actor + Recipe and does not split when the material inventory source changes
- recipe cards keep tool requirements informational rather than coloring them as pass/fail state
- recipe cards display total crafting duration with a clock icon (N hours) as core recipe information
- recipe total crafting durations must be positive multiples of 2 hours
- automatic normal/no-tool DC selection based on confirmed tool possession and proficiency
- higher no-tool DCs use a compact warning tooltip rather than duplicating status text
- recipe readiness is communicated by per-requirement red/green inventory counts rather than redundant Ready/Missing Materials header badges
- recursive processing planning
- campaign-specific Content Pack enable/disable controls
- Party/Group actor acquisition recipient support
- Morelord Marketplace material integration boundary

Actual crafting execution is reserved for Craftworks Premium.

Content Packs

Content Packs can contribute:

- materials
- recipes
- Harvest profiles
- Gathering profiles
- Encounter Loot material tiers
- Encounter Loot economy profiles
- premium crafting content

The GM controls active packs from **Configure Craftworks > Content Packs**.

Premium pack availability is determined through Morelord Core. An inactive or unentitled Content Pack contributes no runtime Craftworks content.

Monsters of Drakkenheim setup requirement

Access to the **Monsters of Drakkenheim** Craftworks Content Pack does not install the official Foundry module or its Actors. To give players the ability to harvest Drakkenheim monster material components, the GM must:

1. Install and enable the **Monsters of Drakkenheim** module (drakkenheim-monsters).
2. Create or place monsters using Actors from that module's **Monsters** compendium.

Actors from other compendiums do not provide the official Drakkenheim harvesting data required for those material components.

Standard content is shown without an extra source badge in reference browsers. Premium content uses a compact **Premium** badge to keep recipe/material displays from becoming unnecessarily busy.

See `data/packs/README.md` for the developer-facing Content Pack format and precedence rules.

Material identity

Canonical Craftworks material Items use `flags.morelord-craftworks`, including:

- `materialId`
- `packId`
- `sourceUuid`
- `tags`
- `rarity`
- `category`
- `stage`
- `purchasable`
- `schemaVersion`

Materials are normal D&D5e loot Items with normal quantity and price fields.

Morelord Marketplace boundary

Craftworks defines and acquires materials. It does not provide buying or selling workflows.

Morelord Marketplace can inspect Craftworks Items through:

```
MorelordCraftworks.marketplaceIntegration.isCraftworksItem(item)
MorelordCraftworks.marketplaceIntegration.isPurchasable(item)
MorelordCraftworks.marketplaceIntegration.getMaterialId(item)
```

Public module entry points

```
MorelordCraftworks.open()
MorelordCraftworks.openMaterials()
MorelordCraftworks.openRecipes()
```

Normal users should use the **Morelord Craftworks** Foundry scene-control button rather than the console.

Development material seed

During development, the Standard material seed can be synchronized into the temporary world compendium with:

```
await MorelordCraftworks.dev.installStandardMaterials();
```

The permanent packaged Content Pack format is the intended production model.

Recipe requirement logic

Recipe requirements support three levels of logic:

- top-level requirement groups are **OR** choices
- requirements inside a group are **AND** requirements
- a requirement may contain ingredient alternatives joined by **OR**

For example:

Hide ×1 AND (Stick ×2 OR Pole ×1)

OR

Rawhide ×5 AND Pole ×4

This allows one recipe/output to represent materially different valid crafting paths without creating duplicate recipes for the same output.

Crafting lifecycle

When the selected inventory satisfies a recipe and a Crafter Actor is selected, the Recipe browser exposes a Craft action.

- starting a job chooses a complete valid material path
- if multiple valid OR paths are available, the player chooses which materials to use
- recipe materials are consumed once when crafting begins
- the first Craft click then rolls the first crafting check
- later clicks roll additional crafting checks without consuming more materials
- rolls are posted to Foundry chat
- the selected Crafter Actor supplies the check modifier, tool proficiency, DC, and persistent progress
- every attempt represents 2 hours spent
- a success adds one successful check / 2 hours of progress
- a failure adds time spent but no crafting progress and loses no additional materials
- crafting progress is persisted on the Crafter Actor and keyed by recipe
- changing the displayed material inventory does not create a separate progress track
- the inventory actor used when the job began remains the material/output destination for that job
- Cancel Crafting refunds the materials consumed at job start
- when the required successes are reached, Craftworks automatically awards the recipe output
- Craftworks material outputs and Foundry Item UUID outputs are both supported
- Standard finished-item recipes must resolve to real D&D5e compendium Items; unmatched Kibbles-specific/homebrew finished items are excluded
- official recipe outputs use the real compendium Item document, preserving its Foundry image and system data
- completed jobs remain visible as Crafting Complete and can be started again when another valid set of materials is available

Recipes display persistent progress such as 1 of 4 Successes · 2 of 8 hours progress · 2 hours spent. Because every crafting check represents 2 hours, recipe total crafting times must be defined in 2-hour increments.

Crafting time model

Craftworks uses a common timing model for recipe execution:

- recipes display their **total crafting time**
- internally, each crafting check represents **2 hours** of work
- the total time determines how many successful checks are required
- a successful check contributes 2 hours of crafting progress
- a failed check still consumes 2 hours of character time but contributes no progress
- failed checks do not consume the recipe's materials
- once crafting is initiated, recipe UI can display progress such as Yes 1 of 4 Successes
- the check itself does not change when the required tool is missing
- lacking the required tool increases the recipe DC; the default increase is **+5**
- owning a tool and being proficient with that tool are separate concepts

Recipes may define their total hoursRequired. Craftworks should use source-backed values where available rather than inventing recipe durations.

Future development

GM homebrew content

Homebrew authoring is planned as a **Standard/free** Craftworks feature.

The intended model is a world-specific **Homebrew** Content Pack that is always available to the GM and is not premium-gated.

Planned homebrew material support includes:

- creating and editing Craftworks materials/components
- name, image, rarity, category, processing stage, and tags
- normal D&D5e value and Craftworks purchasable metadata
- acquisition configuration for Harvesting, Gathering, and Encounter Loot
- use in normal Craftworks recipe matching and inventory workflows

Planned homebrew recipe support includes:

- exact material requirements
- tag/category/rarity/stage matching
- quantities and sameMaterial requirements
- multiple required ingredients
- alternative ingredient requirements
- processing recipes that output another Craftworks material

- finished recipes that output an existing Foundry Item
- normal Recipe browser visibility with a clear Homebrew source label

Homebrew definitions should eventually support JSON import/export so GMs can move custom Craftworks content between worlds and share community content packs.

The same data model used by homebrew authoring should remain compatible with Morelord-authored Content Packs so recipe/material definitions do not require separate runtime systems.

Development release history

Development-build notes are maintained in `RELEASES.md`.

Third-party content

Standard crafting data adapted from Kibbles' Compendium of Craft and Creation is documented in `ATTRIBUTION.md`; applicable Open Game License terms are included in `OPEN-GAME-LICENSE-1.0a.txt`.

Material images

Standard material definitions store static Foundry-relative `icons/...` paths. For Kibbles-defined crafting materials, those paths are copied during development from the corresponding Kibbles crafting-material compendium Items. Craftworks does not query, require, or depend on the Kibbles Foundry module at runtime.

The Standard Materials world compendium is synchronized from Craftworks' own static seed so existing worlds receive corrected icon paths after module updates.

Standard D&D content packs

The Standard subscription separates D&D SRD recipe content by rules generation:

- **SRD 5.2** contains only Kibbles-defined recipes whose finished output resolves in the D&D5e `dnd5e.equipment24` compendium.
- **SRD 5.1** contains only Kibbles-defined recipes whose finished output resolves in the D&D5e `dnd5e.items` or `dnd5e.tradegoods` compendiums.
- The two recipe sets intentionally remain separate and may contain equivalent recipes, such as healing potions.
- A recipe output is never resolved across SRD generations. Disabling SRD 5.1 prevents SRD 5.1 recipe definitions and Item UUIDs from participating.
- `standard-core` provides the shared Kibbles-defined material vocabulary and acquisition/reference infrastructure but does not contribute finished-item recipes.
- The Standard material seed contains only material identifiers actually referenced by the imported Kibbles recipe data.

Shared materials and recipe source labels

`standard-core` remains the shared Craftworks content pack for the exact Kibbles crafting material vocabulary plus harvesting, gathering, encounter loot, and hoard infrastructure. SRD 5.2 and SRD 5.1 own their finished-item recipe catalogs.

Recipe cards display descriptive source labels such as SRD 5.2, SRD 5.1, Player's Handbook, and Monsters of Drakkenheim rather than rules-year labels.

Catalog query filters

Recipe catalog filters are checkbox-based multi-select controls. Selecting more than one value within a filter uses OR semantics within that filter, while different filter groups are combined with AND semantics. Content Pack selectors only list enabled packs that currently contain records.

The Material browser uses the same multi-select Content Pack behavior. Search text keeps the user's exact caret/selection across live-count rerenders.

Spell Scroll Generator

Spell Scroll Generator is a premium GM utility. It builds the available spell pool from spell Items in compendiums currently available to the world, filters by scroll level, and can generate a random spell result. The utility is exposed through the Craftworks API/dashboard foundation for future scroll creation and loot integration.

D&D5e source filtering

Randomized compendium-backed features respect the D&D5e system's Configure Sources selection. Craftworks treats a compendium as available unless D&D5e's packSourceConfiguration setting explicitly disables it.

This source filter applies to Spell Scroll Generator, Encounter Loot special treasure, and Hoard special treasure. Recipe catalogs intentionally use Craftworks Content Pack settings instead and do not follow D&D5e's source filter.

Hoard chat and special treasure

Generated Hoards can be sent to chat as a formatted Craftworks card. Special treasure results resolve to actual Item documents. When a RollTable produces a plain-text item name, Craftworks attempts to resolve that name against enabled Item compendiums before awarding the result.

Generated spell scrolls

The premium Spell Scroll Generator can create and award an Item based on the official enabled spell-scroll template for the chosen level. The generated Item keeps the official scroll mechanics/image and records the selected spell in its name, description, and Craftworks flags.

Randomized Item source resolution

For randomized treasure and generated scrolls, Craftworks uses the D&D5e system's Configure Sources setting, not Craftworks Content Pack settings.

Treasure-table document links are treated as references to an item concept. If a table points at an Item in a disabled source, Craftworks uses that Item's name and searches the currently enabled D&D5e Item compendiums for an equivalent Item. This supports worlds that disable the built-in SRD packs while using official PHB/DMG or other sourcebook compendiums.

Hoard chat cards use native Foundry UUID content links for resolved Material and Special Treasure Items. The displayed names therefore open the actual Item documents used by Craftworks rather than acting as plain text labels.

Randomized compendium priority

When more than one enabled compendium contains the same randomized Item or Spell, Craftworks prefers enabled non-SRD sourcebooks first. SRD sources are fallbacks, ordered newest to oldest: SRD 5.2 before SRD 5.1, followed by any older or unrecognized SRD source.

Recipe discovery visibility

Recipes are visible by default. GMs can hide or show individual recipes from the Recipe browser and can bulk Hide All or Unhide All. Hidden recipes remain available to the GM for management and existing crafting jobs, but are omitted from normal player recipe browsing. Recipe visibility is world-persistent and independent of Content Pack enablement.

Catalog auto-display threshold

Materials and Recipes continue to support explicit Search for large catalogs. When the current filter/search scope contains 50 or fewer records, Craftworks displays those records immediately while retaining all active filters.

Multi-select behavior

Craftworks multi-select filters close when the user clicks outside them. Only the selector explicitly being edited is preserved across the rerender required to update its checkbox state.

Materials supports Content Pack, Rarity, and Tag multi-select filters.

Randomized Item source labels

Generated spell-scroll results and Special Treasure results include the descriptive label of the resolved D&D5e source compendium, such as Player's Handbook, Dungeon Master's Guide, SRD 5.2, or SRD 5.1.

Native D&D5e crafting roll dialog

Crafting checks use the D&D5e system's native D20 roll pipeline when running on D&D5e. Craftworks invokes the appropriate native skill, tool, or ability check, which presents D&D5e's standard roll configuration dialog before the roll.

This allows one-off Normal/Advantage/Disadvantage selection and situational bonus formulas while preserving actor-specific D&D5e bonuses, effects, skill proficiency, and tool proficiency. Craftworks then reads the completed native roll total and compares it with the recipe DC.

Closing the D&D5e roll dialog does not count as a failed crafting attempt.

Craft workspace

Materials and Recipes are reference tools. Recipes do not execute crafting. A character can mark recipes for crafting, and those marked recipes appear in the dedicated Craft workspace without search controls.

Marked recipes are persisted on the crafter Actor. Craft uses the current character context: a controlled character token first, then the user's assigned Character, then the user's single owned Character when unambiguous.

Craft has one inventory selector for the Actor or Group supplying ingredients. Marked recipes are grouped into collapsible In Process, Craftable, and Not Craftable sections. Crafting progress remains tied to Crafter + Recipe.

A session-only Craft log is held in the Craft application instance. It survives closing/reopening the Craft window during the current Foundry client session and resets when the client reloads.

Successful crafting opens a completion window using the actual output Item from its source compendium. The player chooses the output destination after success: their own crafter inventory, or the configured Party Group inventory when a valid Group recipient exists.

Native D&D5e skill-check configuration

Player-facing Craftworks skill checks use the D&D5e system's native skill-roll configuration dialog. This includes Harvesting and Gathering as well as any other workflow routed through the D&D5e adapter's `rollSkill()` method.

The native dialog is intentionally not fast-forwarded, allowing the player to choose Normal, Advantage, or Disadvantage and enter a situational bonus before rolling. Closing the dialog does not consume or record an acquisition attempt.

Installation

After the first GitHub release is published, install Morelord Craftworks in Foundry using this permanent manifest URL:

<https://raw.githubusercontent.com/tmoreland72/morelord-craftworks/main/module.json>

Release workflow

Morelord Craftworks uses the standard Morelord Foundry module release workflow shared with Morelord Marketplace and Morelord Drakkenheim Harvesting.

Project-specific release settings are stored in `release.config.json`. Local website publishing credentials belong in `.env`:

```
RELEASE_PUBLISH_TOKEN=your-token-here
```

Release notes use the standard filename format `RELEASE-NOTES-0.1.0.md`.

Validate a release without modifying GitHub or the website:

```
.\release.ps1 -Version 0.1.0 -DryRun
```

Publish the release:

```
.\release.ps1 -Version 0.1.0
```

Morelord Craftworks User Guide

Version 0.3.0

Morelord Craftworks brings harvesting, gathering, encounter loot, treasure hoards, crafting materials, recipes, crafting workflows, and GM treasure-generation tools into one Foundry VTT module.

This guide is written for Game Masters and players using Craftworks in a D&D5e world.

1. Requirements

Craftworks currently requires:

- Foundry Virtual Tabletop v14
- D&D5e system 5.3 or later
- SocketLib
- Morelord Core

Some Craftworks content packs and tools also require the appropriate Morelord account entitlement. Content tied to official D&D or Drakkenheim material may also require the corresponding Foundry content to be installed in the world.

2. Opening Craftworks

Use the **Morelord Craftworks** button in Foundry's scene controls to open the main dashboard.

The dashboard is divided into three areas.

Acquire

GM-only tools for obtaining resources and treasure:

- **Harvest**
- **Gather**
- **Loot**
- **Hoard**

Craft

Reference and crafting tools:

- **Materials**
- **Recipes**
- **Craft**

Tools

GM utilities:

- **Spell Scroll Generator**

- Spellbook Generator

Players can use the Materials, Recipes, and Craft tools available to them. Acquisition sessions are started by the GM.

3. First-Time Configuration

Open **Game Settings > Configure Settings > Module Settings > Morelord Craftworks** and select **Configure Craftworks**.

Content Packs

The Content Packs section controls which Craftworks material, recipe, harvesting, gathering, loot, and crafting definitions are active.

Craftworks may offer content such as:

- Standard Craftworks materials
- SRD 5.2
- SRD 5.1
- Player's Handbook
- Dungeon Master's Guide
- Monsters of Drakkenheim

Only packs that are enabled and available to the connected account participate in Craftworks.

Sync with Compendiums

Craftworks keeps its world material compendiums and external D&D5e content references synchronized automatically.

When the first active GM enters a world, Craftworks compares the current content environment with the last successful synchronization. A new sync runs only when something relevant changed, including:

- the Craftworks version
- the D&D5e system version
- enabled Craftworks Content Packs
- available Item compendiums
- versions of active modules that provide Item compendiums

This avoids rewriting Craftworks material compendiums on every world load while still detecting newly installed source content.

The GM can force a rescan at any time from **Craftworks Settings > Content Packs > Sync with Compendiums**. A manual sync updates Craftworks material compendiums, refreshes external D&D5e Item-compendium discovery, and reloads the recipe index.

Morelord Account Access

The top of Craftworks Settings shows the current Morelord Core connection and access tier.

Use:

- **Manage Account** to open account management
- **Refresh** to refresh entitlements after an account or subscription change

4. Material Storage

Craftworks can award acquired materials to individual characters or to a shared party Actor.

Individual Storage

Leave **Use Party Actor for Acquired Materials** disabled.

Harvesting and Gathering use the participating character as the normal recipient.

Shared Party Storage

Enable **Use Party Actor for Acquired Materials** and select a D&D5e Group actor under **Party Recipient Actor**.

When enabled, supported acquisition workflows route their awarded Craftworks materials to that shared Group actor.

Materials

Three-State Filters

The Materials and Recipes browsers use the same long-list filtering pattern and layout as Morelord Marketplace. Filters appear in a left sidebar. Clicking a filter cycles through:

1. **Neutral** - the filter does not affect results.
2. **Include (+)** - results must match the selected value.
3. **Exclude (-)** - results matching the selected value are removed.

Recipes also include **Known** and **Unknown** knowledge filters.

The Recipes **Rarity** filter uses the public rarity of the recipe/output item. It remains usable even when a recipe is Unknown and does not reveal hidden ingredient rarity.

The list itself is only rendered when the current search and filters reduce the catalog to **100 or fewer results**. Above 100, the results pane shows the current match count and asks you to refine the filters. Search text and filter-state changes update this count immediately.

For Game Masters, **Mark Context Known** and **Mark Context Unknown** apply only to recipes matching the current search and filter context. They do not change recipes outside the current result set.

5. Materials Browser

Open **Materials** from the Craftworks dashboard to browse the materials currently indexed from active content packs.

Materials can include information such as:

- name
- image
- rarity
- category
- processing stage
- value
- tags
- acquisition methods
- recipes that use the material

Materials are reference data. Crafting does not occur from the Materials browser.

Recipes and Crafting

6. Recipes Browser

Recipe Knowledge

A recipe can be **Known** or **Unknown**:

- **Known** - the recipe and its ingredient requirements are visible.
- **Unknown** - the recipe remains searchable and may be marked as a crafting goal, but its ingredient requirements are concealed.

Game Masters control this state from the Recipes browser. **Mark Context Known** and **Mark Context Unknown** affect only recipes matching the current search and filter context.

Open **Recipes** to search and review available recipes.

Recipe cards show the information needed to understand how an item is made, including its material requirements and output.

Recipes are a reference tool. Actual crafting is performed from the **Craft** window.

Marking a Recipe for Crafting

Use the recipe's crafting marker/bookmark control to mark a recipe.

Marked recipes automatically appear in the **Craft** window. This lets a player build a short list of the recipes they currently intend to work on without searching again each time.

7. Craft Window

Open **Craft** from the dashboard.

The Craft window shows recipes marked by the selected Crafter and compares their requirements against the selected inventory Actor.

A recipe shows whether each requirement is available or missing.

Craftworks supports requirements such as:

- an exact material
- material rarity
- material category
- processing stage
- tags
- alternative ingredients
- requirements where several units must come from the same material

Crafter vs. Inventory

The **Crafter** is the character performing the work.

The **inventory Actor** is the Actor supplying the required materials and receiving the finished output for that crafting job.

Crafting Checks

When a recipe requires checks, Craftworks uses the Crafter's D&D5e roll data and the native configured roll dialog.

Crafting progress persists between attempts.

Crafting Time

Craftworks tracks successful crafting progress and total time spent. A failed crafting attempt can spend time without adding successful progress.

Cancel Crafting

If an active crafting job is cancelled, Craftworks returns materials that were consumed when that job began.

No-Check Recipes

Some source material defines crafting that does not require a skill check. Craftworks supports these recipes and advances them according to their defined workflow instead of inventing a check.

Harvesting

8. Starting a Harvest

Harvesting is started by the GM.

1. Place or leave defeated creature tokens on the current scene.
2. Open **Craftworks > Harvest**.
3. Review the creatures Craftworks detected.
4. Review any special harvesting information.

5. Choose whether any player characters should **Skip Skill Checks**.

6. Click **Start Harvest**.

Each connected player receives a Harvest window.

9. Harvest Preflight

Before starting the session, the GM sees the dead creatures detected on the current scene.

The preflight display includes information such as:

- creature name
- creature type
- CR
- Harvest DC
- Harvest rarity when applicable

For standard creatures, Craftworks resolves the complete Kibbles harvesting model. Depending on the creature's type, CR, size, AC, and resistances, its offering can include:

- basic hide, carapace, scale, meat, or fresh-ingredient harvesting
- an exotic harvest result
- an exotic remnant result for applicable creature types
- special tough hide, resistant hide, dragon scale, or higher-rarity meat

Dice quantities and the exotic d100 result are generated once for the corpse and shared by every participant in that Harvest session.

Skip Skill Checks

The **Player Characters** section lists active player characters.

Check **Skip Skill Checks** for a character when you want that character to automatically succeed at Harvesting during this session.

A skipped character does not roll a Harvest skill check. Their player goes directly to the available claim choices.

This is useful when:

- the GM wants to waive checks for a particular scene
- the party has already earned automatic success
- testing or demonstration is needed
- a campaign rule makes harvesting automatic

10. Harvest Skill Checks

When a character is not set to **Skip Skill Checks**, the player uses the single **Harvest Skill Check** control at the top of the Harvest window.

1. Choose the Harvest skill to use.

2. Click **Roll Harvest Checks**.
 3. Craftworks automatically rolls that skill separately against every unresolved creature available to that character.
 4. Each creature resolves against its base Harvest DC.
 5. Successful creatures immediately expose every component whose individual Harvest DC the roll also meets.
 6. Failed creatures show their failed result and consume that character's Harvest attempt for that creature.
- Creatures already attempted, already resolved, or automatically succeeded through **Skip Skill Checks** are not rolled again.

Large Encounters

This batch workflow is specifically designed for combats with many defeated creatures. A player does not need to repeat the same skill selection and Roll action for every corpse.

Craftworks still preserves an individual result for each creature, including:

- roll total
- success or failure
- Harvest DC
- natural d20 result
- natural-20 bonus claim eligibility

Natural 20

Craftworks can allow a natural 20 to grant two component claims instead of one.

This behavior is enabled by default and can be disabled in Craftworks Settings under **Harvesting > Natural 20 Grants Two Claims**.

The bonus uses the actual active d20 result, not a modified total of 20.

11. Claiming Harvest Components

After a successful check, the player chooses from the highlighted components available to them.

A claim is a **reservation**, not an immediate inventory award.

When a player claims a component:

- the component becomes reserved for that player
- all open Harvest windows synchronize the claim
- the displayed dice quantity is reserved with the component
- standard Kibbles results remain independently claimable by every successful participant
- exact Drakkenheim monster components remain finite and exclusive
- the item is **not yet added to inventory**

This design lets the GM Reset or Cancel a Harvest session without needing to remove inventory items.

Needed for Crafting

If a Harvest material is needed by a recipe that the player's current Crafter has marked for crafting, Craftworks highlights it with **Needed for Crafting**.

This makes it easier to recognize components that directly advance the player's current crafting plans.

12. Claimed Components

During a Harvest session, the GM and players can see a shared **Claimed Components** list.

The list can show:

- component image
- component name
- rarity
- source creature
- claimant
- Harvest roll

Claims update in realtime.

13. Finalize, Reset, and Cancel Harvest

Finalize Harvest

Finalize Harvest commits the session.

Only at this point does Craftworks:

1. award the reserved items to their resolved recipients
2. mark those claims as delivered
3. create one consolidated Award Card per recipient
4. close the Harvest session/windows

Each recipient's Award Card lists all items that recipient received from the Harvest.

Finalize is designed to avoid duplicating items if the finalization process is retried after a partial interruption.

Reset Harvest

Reset Harvest clears the Harvest attempt state so the scene can be harvested again.

Because claims are not awarded until Finalize, resetting an unfinished Harvest does not require removing items from inventories.

Cancel Harvest

Cancel Harvest discards the active Harvest session, resets the Harvest attempt state, and closes all Harvest windows.

No claimed items from the cancelled session are awarded.

Drakkenheim Harvesting

14. Monsters of Drakkenheim Support

When the Monsters of Drakkenheim Craftworks content is active and the corresponding official source content is available, Craftworks can use the creature's exact Drakkenheim Harvestable Components data.

If the Drakkenheim content is not available, the creature falls back to the normal Craftworks harvesting model instead of becoming unharvestable.

Special Harvest Items / Instructions

Some Monsters of Drakkenheim creatures include an **Items:** entry in their Harvestable Components information.

Craftworks displays these entries on the GM's Harvest preflight screen as **Special Harvest Items / Instructions**.

These instructions are informational so the GM knows the creature has additional special loot or handling rules beyond the normal component claim list.

Foundry inline-roll syntax in those instructions is simplified for readability. For example:

`[[/r 2d4]]`

is displayed as:

2d4

Gathering

15. Gathering

Gathering is an individual player activity started by the GM.

The Gather workflow uses the current scene's selected terrain profile.

Players can make the configured Gathering check, and successful results award an appropriate material from that terrain's active content data.

Gathering uses the native D&D5e configured roll dialog.

Gathering opportunities are tracked per character for the scene so reopening the tool does not automatically provide unlimited repeat attempts.

16. Gathering Settings

Craftworks Settings provides:

- **Global DC Modifier**

- **Quantity Multiplier**
- **Rare Result Bias**
- individual **Terrain Gather DCs**

Each terrain shows its normal source-pack DC and an editable world value.

The Global DC Modifier is applied after the terrain-specific base DC.

Example:

- Forest base DC: 12
- Global DC Modifier: +2
- Final Forest Gather DC: 14

Encounter Loot

17. Loot

Loot is a GM-run party-level encounter workflow.

It evaluates unresolved defeated creatures on the current scene and can generate:

- Craftworks materials
- coin
- special treasure

Loot is resolved once for the encounter rather than once per player.

Craftworks tracks resolved corpse loot so reopening Loot does not automatically farm the same defeated tokens again.

Loot Settings

The GM can enable or disable:

- Materials
- Coin
- Special Treasure

The GM can also configure:

- material chance modifier
- coin chance modifier
- special treasure chance modifier
- material quantity multiplier
- coin multiplier

Treasure Hoards

18. Hoard

Use **Hoard** for a lair, vault, cache, reward chest, or other accumulated treasure source rather than ordinary post-combat loot.

A generated hoard can include:

- Craftworks materials
- coin
- special treasure

When awarded, Craftworks creates a consolidated Award Card for the recipient.

Award Cards

19. Award Cards

When Craftworks awards items or loot, it creates a public chat card summarizing the result.

Award Cards can show:

- recipient
- item image
- clickable item link
- rarity
- quantity
- coin

For multi-item operations, Craftworks groups the items into one card per recipient instead of creating a separate chat message for every item.

For Harvesting, Award Cards are created only after the GM clicks **Finalize Harvest**.

GM Tools

20. Spell Scroll Generator

Open **Spell Scroll Generator** from the GM Tools section.

The generator uses spell compendiums enabled for the world.

Typical workflow:

1. choose the scroll level
2. generate a random spell
3. review the result

4. select the recipient
5. create and award the spell scroll

The resulting scroll retains the selected spell identity and is added to the recipient's inventory.

21. Spellbook Generator

Open **Spellbook Generator** from the GM Tools section.

Use this when the party discovers a wizard's spellbook or another collection of random spells.

Generate a Spellbook

1. Enter a name for the spellbook.
2. Enter how many cantrips and spells of each level should be included.
3. Click **Generate**.
4. Review the randomized spells.
5. Use the external-link icon beside a spell to inspect it.
6. Click **Reroll** if you want a completely new result using the same requested counts.
7. Choose the recipient.
8. Click **Create & Award Spellbook**.

The result is one custom spellbook Item containing the selected spells as clickable Foundry document links.

A public chat card is also created showing the spellbook and its spell contents.

The generated spell list has its own scrollbar so large books can be reviewed without pushing the recipient controls offscreen.

Craftworks Settings Reference

22. Harvesting Settings

Available Harvest controls include:

- **DC Modifier**
- **Minimum Choices**
- **Maximum Choices**
- **Rare Result Bias (%)**
- **Natural 20 Grants Two Claims**

23. Gathering Settings

Available Gathering controls include:

- **Global DC Modifier**

- **Quantity Multiplier**
- **Rare Result Bias (%)**
- per-terrain Gather DC values

24. Encounter Loot Settings

Available Loot controls include:

- Materials on/off
- Coin on/off
- Special Treasure on/off
- Material Chance Modifier
- Coin Chance Modifier
- Special Chance Modifier
- Material Quantity Multiplier
- Coin Multiplier

Troubleshooting

25. A Player Does Not Receive an Acquisition Window

Check that:

- the player is currently connected
- the player has an owned or assigned character where required
- SocketLib is active
- Morelord Craftworks is active for both GM and player clients

For Harvesting, starting the session should open the player Harvest application automatically.

26. Premium Content Is Not Available

Open Craftworks Settings and check the **Craftworks Content Access** card.

Then:

1. verify Morelord Core is active
2. verify the Morelord account is connected
3. click **Refresh**
4. confirm the desired Content Pack is enabled

An enabled pack still requires any entitlement assigned to that pack.

27. A Recipe Says Materials Are Missing

Confirm that the selected inventory Actor contains materials matching the recipe's exact requirements.

Some recipes require more than a matching name. Requirements may specify:

- exact material ID
- rarity
- category
- tags
- processing stage
- same-material quantities

28. A Harvest Claim Did Not Add an Item

This is expected until the GM finalizes the session.

Harvest claims reserve components only. The inventory award occurs when the GM clicks **Finalize Harvest**.

29. Drakkenheim Components Are Not Appearing

Confirm that:

- the Monsters of Drakkenheim Craftworks content pack is enabled
- the account has access to that content pack
- the relevant official Drakkenheim source content is installed and available

Without the Drakkenheim enhancement path, Craftworks intentionally falls back to standard harvesting where possible.

Quick Reference

GM

- **Harvest:** dead creatures > preflight > Start > players claim > Finalize
- **Gather:** select terrain > start session > players roll or decline
- **Loot:** resolve ordinary post-combat party loot
- **Hoard:** generate a cache/lair/vault treasure result
- **Spell Scroll Generator:** random spell > create scroll
- **Spellbook Generator:** choose spell counts > Generate/Reroll > create book
- **Settings:** configure packs, recipients, Harvest, Gather, and Loot behavior

Player

- **Materials:** browse Craftworks materials
- **Recipes:** browse and mark recipes for crafting
- **Craft:** work on marked recipes
- **Harvest:** choose one skill and roll all unresolved creature checks, or claim directly when the GM skips checks
- **Gather:** make the scene's Gathering attempt when the GM starts a session

Version

This guide describes Morelord Craftworks **0.2.2**.

Morelord Craftworks Documentation

Overview

Morelord Craftworks brings harvesting, gathering, encounter loot, treasure hoards, materials, recipes, and crafting workflows into Foundry Virtual Tabletop. Players can browse a campaign's material and recipe catalogs, plan projects, and take part in GM-started acquisition sessions. Game Masters can configure content packs, tune acquisition rules, generate treasure, and create potions, spell scrolls, and spellbooks.

Craftworks keeps materials as normal dnd5e Items. They can live in a character's inventory or in a shared Group actor, allowing a party to gather resources together while a specific character supplies the tools, proficiency, and checks for a crafting project.

Standard material and SRD 5.2 content works without a Morelord account. Other content packs and completed crafting workflows may require the corresponding Morelord entitlement and installed source content.

Craftworks can also support exceptional add-on content packs that go beyond the standard rules.

Monsters of Drakkenheim is the featured example: when the required content and access are available, Craftworks can use creature-specific Harvestable Components, Drakkenheim material families, recipes, and special harvesting instructions while keeping the core Craftworks workflows familiar.

Morelord Craftworks dashboard

See Craftworks in action

Take a guided tour of harvesting, materials, recipes, and crafting workflows.

Choose a manual

- Game Master Manual - installation, world configuration, content synchronization, Harvest, Gather, Loot, Hoard, generators, exceptional content packs, and troubleshooting.
- Player Manual - browsing materials and recipes, planning and completing crafting projects, Harvest, Gather, shared party storage, and optional Drakkenheim content.

These manuals describe Morelord Craftworks 0.4.4 for Foundry Virtual Tabletop v14 and dnd5e 5.3 or later. The in-Foundry **Documentation** button on the Craftworks dashboard opens the current product guide through Morelord Core.

Morelord Craftworks Game Master Manual

Morelord Craftworks gives a dnd5e world a connected system for harvesting creatures, gathering by terrain, generating encounter loot and hoards, managing materials and recipes, and running long-term crafting projects.

This manual applies to Morelord Craftworks 0.4.4, Foundry VTT v14, and dnd5e 5.3 or later.

Contents

- Feature access
- Install and activate
- Open Craftworks
- Configure content and storage
- Configure acquisition rules
- Manage materials and recipes
- Run Harvest
- Run Gather
- Generate encounter loot
- Generate a treasure hoard
- Use the item generators
- Exceptional content: Monsters of Drakkenheim
- Troubleshooting

Feature access

Feature	Standard	Corresponding premium access
Craftworks Standard materials	Yes	Yes
SRD 5.2 content when available	Yes	Yes
Materials and Recipes browsers	Yes	Yes
Harvest, Gather, Loot, and Hoard	Yes	Yes
Recipe planning and progress display	Yes	Yes
Complete crafting execution	No	Yes
Premium content packs	No	Yes

Premium access is managed by Morelord Core. A content pack may also depend on official Foundry content installed in the world. Enabling a pack does not grant access to a source product.

Install and activate

Requirements

- Foundry Virtual Tabletop v14
- dnd5e 5.3 or later
- Morelord Core 0.1.0 or later
- SocketLib 1.1.3 or later
- Morelord Craftworks 0.4.4 or later

Install with the manifest

1. On Foundry's Setup screen, open **Add-on Modules**.
2. Select **Install Module**.
3. Paste this manifest URL into **Manifest URL**:

<https://raw.githubusercontent.com/tmoreland72/morelord-craftworks/main/module.json>

4. Install the module.
5. Open the intended world and choose **Manage Modules**.
6. Enable **SocketLib**, **Morelord Core**, and **Morelord Craftworks**.
7. Save the module configuration and reload when prompted.

Open Craftworks

Open **Token Controls** on the left side of a scene and select the **Morelord Craftworks** control. The dashboard groups its tools into three areas:

Area	Tools
Acquire	Harvest, Gather, Loot, Hoard
Craft	Materials, Recipes, Craft
Tools	Potion Generator, Spell Scroll Generator, Spellbook Generator

Acquisition and generator tools are GM-operated. Players can use the reference and crafting tools available to them and receive interactive Harvest or Gather windows when the GM starts a session.

The Morelord Craftworks dashboard groups acquisition, crafting, and generator tools.

Configure content and storage

Open **Game Settings > Configure Settings > Module Settings > Morelord Craftworks**, then select **Configure Craftworks**.

Craftworks settings show account access, content packs, synchronization, storage, and acquisition rules.

Account and content access

The access panel shows the Morelord Core connection, current access tier, and most recent entitlement state. Use **Manage Account** to change the connection and **Refresh** after an account or subscription change.

Craftworks Standard and SRD 5.2 are enabled automatically in a fresh world and do not require authentication. Premium packs remain unavailable until their requirements are satisfied.

Content Packs

Enable only the packs that should contribute to the campaign. Depending on installed sources and access, the list can include:

- Craftworks Standard
- SRD 5.2

- SRD 5.1
- Player's Handbook
- Dungeon Master's Guide
- Monster Manual
- Monsters of Drakkenheim

An active pack can contribute materials, recipes, Harvest and Gather profiles, encounter-loot rules, economy profiles, and crafting definitions. Disabled or unavailable packs contribute no runtime content.

The Monsters of Drakkenheim content pack is enabled separately from standard Craftworks content.

Synchronize compendiums

Craftworks automatically synchronizes when the first active GM enters the world and a relevant content signature has changed. The signature includes Craftworks and dnd5e versions, enabled content packs, available Item compendiums, and versions of active modules that supply Item compendiums.

Select **Sync with Compendiums** after installing or updating source content, changing dnd5e's configured sources, or troubleshooting a missing material or recipe. Synchronization updates Craftworks material compendiums, refreshes external Item discovery, and rebuilds the recipe index.

Generated compendium-backed rewards respect the dnd5e **Configure Sources** selection. A disabled source is excluded when results are generated and checked again before an award is committed.

Choose the acquisition recipient

By default, Harvest and Gather materials go to the participating character. To centralize resources:

1. Enable **Use Party Actor for Acquired Materials**.
2. Choose a dnd5e Group actor under **Party Recipient Actor**.
3. Save the configuration.

The selected Group actor becomes the default recipient for supported acquisition awards. Loot and Hoard also let the GM choose from player characters and Group actors before awarding a result.

Configure acquisition rules

Harvesting

Setting	Effect
DC Modifier	Adjusts every calculated Harvest DC.
Minimum Choices	Sets the lower bound for component choices.
Maximum Choices	Sets the upper bound for component choices.
Rare Result Bias (%)	Shifts random choices toward rarer components.
Natural 20 Grants Two Claims	Gives a second claim when the active d20 is a natural 20.

Gathering

Setting	Effect
Global DC Modifier	Adjusts every terrain's Gather DC.
Quantity Multiplier	Multiplies awarded material quantities.
Rare Result Bias (%)	Shifts successful results toward rarer materials.
Terrain Gather DCs	Overrides the source-pack DC for individual terrains.

The final Gather DC is the terrain value plus the global modifier.

Encounter Loot

The Loot settings independently enable materials, coin, and special treasure. Chance modifiers tune the frequency of each category, while material-quantity and coin multipliers adjust result sizes.

Potion and spell-scroll rewards use enabled dnd5e Item sources. Material components remain the most common results and potions are more common than spell scrolls.

Manage materials and recipes

Browse large catalogs

Materials and Recipes use a search field and persistent filter rail. Facets cycle through three states:

Symbol	State	Meaning
Empty circle	Any	This value does not affect the result.
Plus	Include	Results must match the value.
Minus	Exclude	Matching results are removed.

Search and filter totals always reflect the complete catalog. The browser initially renders up to 300 matching cards to keep very large catalogs responsive.

Materials can be filtered by source pack, rarity, category, processing stage, and material tags. Recipes add filters for recipe/output rarity and knowledge state.

The Materials browser combines catalog totals, search, tri-state filters, and rich material cards.

Drakkenheim materials are organized into concise setting-specific families.

Control recipe knowledge

Recipes are either **Known** or **Unknown**. An Unknown recipe remains discoverable and can be marked as a crafting goal, but its ingredient requirements are concealed from players and a player cannot begin a new job from it.

Use **Mark Context Known** or **Mark Context Unknown** to update only the recipes matched by the current search and filters. This makes it possible to reveal a family of recipes without changing unrelated entries.

The Recipes browser exposes knowledge controls, filters, requirements, and crafting status.

Drakkenheim recipes remain visibly attributed while using the normal Craftworks recipe workflow.

Understand crafting context

The **Using Crafter Actor** performs checks and supplies tool possession and proficiency. The **Using Actor Inventory** supplies ingredients and receives the output. These can be different actors, so a character can craft from a shared Group inventory.

Crafting progress belongs to the crafter-and-recipe combination and does not split when the inventory source changes. Each attempt represents two hours. Failed checks consume time but not recipe materials. Recipe durations must be positive multiples of two hours.

Recipes may require a facility tier supplied by the current Morelord Core Location, such as a forge. An active **On the Road** Downtime context overrides the scene location. A job pauses while its facility is unavailable and resumes when the requirement is met. **Manage Locations** is available with the other GM tools on the Craftworks dashboard.

Craftworks exposes marked and active crafting projects to Morelord Downtime. Opening one from Downtime launches a focused Craft window for that crafter and recipe while Craftworks remains authoritative for ingredients, checks, progress, and output.

Craftworks automatically chooses the normal or no-tool DC from confirmed tool possession and proficiency. Some recipes require no check and advance through their defined workflow without inventing

one.

The Craft workspace separates filtering, crafter and inventory context, requirements, and project progress.

Run Harvest

Harvest is a synchronized session in which players test their characters against defeated creatures and reserve components for a final award.

Start the session

1. Keep defeated creature tokens on the active scene.
2. Open **Craftworks > Harvest**.
3. Review the detected defeated dnd5e NPC tokens.
4. Include actual harvestable creatures and exclude shopkeepers, traps, or other defeated NPC-based tokens.
5. Use **Select All** or **Clear All** when useful.
6. Review creature type, CR, Harvest DC, rarity, components, and special instructions.

7. Select the participating player characters. Defaults follow the primary populated party, then player-owned characters, and the last successful selection is remembered.
8. Optionally enable the single **Skip Skill Checks** option for every included character.
9. Select **Start Harvest**.

The GM Harvest preflight identifies defeated creatures and lets the GM include participants and bypass checks selectively.

At least one defeated NPC and one player character must be selected. Each selected character controlled by a connected player receives an independent Harvest window. One user controlling two selected characters receives two character-titled windows with separate checks and claims. An included offline character receives no window during that session.

Monitor checks and claims

A player chooses one Harvest skill and uses **Roll Harvest Checks**. Craftworks rolls that skill separately against every unresolved creature available to the character. Success exposes component choices; failure consumes that character's attempt for that creature.

A claim reserves a component but does not add it to inventory. All open Harvest windows synchronize reservations, claimants, source creatures, and roll results. Other players cannot reserve the same component.

Claiming does not automatically collapse the creature. The stable expanded list reduces disruptive window movement during large harvests; players can still collapse entries manually.

The GM view tracks every participant's checks, outcomes, and component claims in real time.

Finalize, reset, or cancel

- **Finalize Harvest** awards reserved items, marks them delivered, creates one consolidated chat card per recipient, and closes the session.
- **Reset Harvest** clears attempt state so the scene can be harvested again. Unfinalized claims have not entered inventories.
- **Cancel Harvest** discards the session, clears its attempt state, closes the windows, and awards nothing.

Finalization is designed to avoid duplicate delivery if it is retried after an interruption.

A finalized Harvest produces a consolidated, linked award card.

Run Gather

Gather is a GM-started, scene-based opportunity for individual characters.

1. Open **Craftworks > Gather** on the intended scene.
2. Select the terrain profile.
3. Review the displayed DC and active participants.
4. Select participants using the same party-priority character picker as Harvest. The previous successful selection is remembered.
5. Start the session. Every included character owned by a connected user receives an independent window, including multiple characters owned by one user.
6. Players choose an allowed skill and make the configured dnd5e roll, or decline.
7. Successful results award a material appropriate to the terrain.

Gather attempts are tracked per character and scene. Reopening the tool does not grant unlimited repeat attempts. Use the GM reset control only when the scene should offer a new opportunity.

The GM Gather preflight selects terrain, shows its DC, and identifies eligible participants.

The reset state makes the scene-level attempt controls explicit.

A completed Gather award is summarized in chat with its material and recipient.

Generate encounter loot

Loot is a party-level post-combat workflow and resolves applicable defeated creatures once for the encounter.

1. Open **Craftworks > Loot** on the scene containing defeated tokens.
2. Review the encounter creatures and generated **Encounter Haul**.
3. Open linked items when you need to inspect a result.
4. Use **Reroll** to replace the current generated result or **Reset** to clear the encounter's resolved state when appropriate.
5. Choose a player character or Group actor under **Recipient**.
6. Select **Award Encounter Loot**.

A result can include materials, coin, potions, spell scrolls, and special treasure. The final award is summarized in a consolidated public chat card with clickable item references.

Encounter Loot begins with the resolved creatures, enabled reward categories, and recipient context.

Morelord Craftworks – Encounter Loot

Encounter Loot

Resolve materials and coin from every dead creature, plus one rare special-treasure check for the encounter.

Corpse Results

Goblin Warrior

Reroll

Reset

Award Encounter Loot

The generated Encounter Haul can be inspected, rerolled, reset, and awarded.

The Encounter Loot award card consolidates the delivered result.

Generate a treasure hoard

Use Hoard for a vault, cache, lair, reward chest, or other accumulated treasure rather than ordinary corpse loot.

1. Open **Craftworks > Hoard**.
2. Set the hoard's parameters and generate the result.
3. Review its materials, currency, potions, spell scrolls, and special treasure.
4. Choose a player character or Group actor.
5. Award the hoard.

Every generated hoard includes potion and spell-scroll rewards in addition to its other configured results. Awards produce a consolidated chat card.

Hoard setup provides a challenge range and recipient before generation.

A generated hoard combines materials, consumables, currency, and special treasure.

The hoard summary presents the generated cache before delivery.

The final hoard card records what the chosen recipient received.

Use the item generators

Potion Generator

Open **Potion Generator**, choose quantities with the numeric fields or visible up/down controls, and generate a result from enabled dnd5e sources. Use **Display Results in Chat** to share a draft - such as a shop's current stock - without creating or awarding Items. To award it, choose a recipient and create the award. The source is validated again before delivery.

Potion Generator setup controls the number of random potions to draw.

Generated potions show their names, sources, document links, recipient, and reroll control.

The potion award card records quantities, rarities, and recipient.

Spell Scroll Generator

1. Open **Spell Scroll Generator**.
2. Enter the number of scrolls to generate at each level, from cantrip through level 9, using the numeric fields or up/down controls.
3. Select **Generate** and review the random spells from enabled compendiums.
4. Open a source document when you need to inspect a result, or use **Reroll** to replace the draft.
5. Optionally select **Display Results in Chat** to share the draft without creating Items.
6. Choose the recipient.
7. Select **Award Generated Spell Scrolls**.

Generated scrolls use dnd5e's native scroll conversion, preserve the selected spell's usable mechanics, support levels above 1, and keep a link to the source spell.

Morelord Craftworks – Spell Scroll Generator

Generate

Spell Scroll Generator accepts independent quantities for cantrips and spell levels 1 through 9.

Generated scrolls are grouped by level and retain visible source attribution.

The spell-scroll award card shows the created Items, rarities, quantities, and recipient.

Spellbook Generator

1. Open **Spellbook Generator**.
2. Name the spellbook.
3. Enter the desired number of cantrips and spells at each level using the numeric fields or up/down controls.
4. Select **Generate**.
5. Inspect spell links and use **Reroll** if needed.
6. Choose a recipient.
7. Select **Create & Award Spellbook**.

Craftworks creates one custom spellbook Item containing clickable spell links and posts a public award card.

Spellbook Generator accepts a book name and independent spell counts at every level.

The generated spellbook draft groups linked spells by level and supports rerolling before delivery.

The awarded spellbook card preserves its name, recipient, level structure, and clickable spell references.

Exceptional content: Monsters of Drakkenheim

The standard Craftworks experience does not depend on Drakkenheim. **Monsters of Drakkenheim** is an optional, exceptional content pack that demonstrates how deeply a supported setting can extend the same materials, recipes, acquisition, and crafting framework.

Requirements

The enhanced experience requires:

- the **Monsters of Drakkenheim** Craftworks Content Pack enabled
- the corresponding Morelord account entitlement
- the supported official Monsters of Drakkenheim Foundry content installed and available

Enabling the Craftworks pack does not provide or unlock the official source product. After installing or changing the source content, run **Sync with Compendiums**.

What the pack adds

When its requirements are satisfied, the pack can contribute:

- Drakkenheim material families such as animus, bones, dust, fluid, hair, hide, natural weapons, and organs
- rarity-specific Drakkenheim materials
- exact creature-specific Harvestable Components data
- Drakkenheim recipes and ingredient relationships
- all 19 Appendix E SRD recipe variants for enhanced armor, shields, weapons, healing and resistance potions, and spell-scroll tiers
- Harvest, Gather, Loot, and other content definitions supplied by the pack
- special harvesting notes that do not fit the ordinary component-claim model

The Materials and Recipes browsers group Drakkenheim filters into concise top-level families, so users can explore the setting content without navigating an unmanageably long flat list.

Drakkenheim content is not isolated in a separate mode. When enabled, its materials, recipes, potions, and spells participate in the same searches and generators as other active sources. Results retain their source attribution: for example, a potion draft can mix core potions with **Trollblood Potion**, **Vampire Blood Potion**, and **Greater Rejuvenation Potion**, while scroll and spellbook drafts can include Drakkenheim spells beside core spells.

Recipe outputs prefer enabled premium PHB or DMG documents when the connected account has access, then fall back to SRD 5.2. Healing potions can also use SRD 5.1. Enhanced armor, shield, and weapon recipes use the generic **+1**, **+2**, or **+3** source item; the GM configures the completed item as the intended equipment.

Drakkenheim Harvest preflight

For a supported creature, Craftworks inspects its official source data and matches its listed Harvestable Components to canonical Craftworks materials. Review those matches in the GM preflight before starting the session.

Some creatures also include an **Items:** entry or special handling rule. Craftworks presents it as **Special Harvest Items / Instructions**. This information is intentionally GM-facing and informational: it calls attention to exceptional treasure or procedures outside the ordinary material reservation workflow.

Players still use the normal Harvest experience - roll against each creature, reserve an available component, and wait for the GM to finalize the awards. The content is richer, but the workflow remains consistent.

Graceful fallback

If the official Drakkenheim creature or harvesting data cannot be resolved, Craftworks falls back to standard harvesting where possible rather than making the creature unusable. Missing enhanced results should therefore be diagnosed as a content-pack, entitlement, source-installation, or synchronization issue - not as a requirement for ordinary Craftworks operation.

Troubleshooting

Materials or recipes are missing

- Confirm the corresponding Content Pack is enabled and available.
- Confirm required official content is installed.
- Check dnd5e **Configure Sources** for the expected Item compendium.
- Select **Sync with Compendiums** in Craftworks Settings.
- Reopen the browser after synchronization finishes.

Premium content is locked

- Confirm Morelord Core is active.
- Use **Manage Account** in Craftworks Settings.
- Select **Refresh** after connecting or changing access.
- Confirm the desired Content Pack is enabled.

A player does not receive Harvest or Gather

- Confirm the player is connected.
- Confirm the player has an assigned or owned character.
- Confirm SocketLib is active for the world.
- Confirm Craftworks is enabled and loaded for both clients.

A Harvest claim did not add an item

Claims are reservations. Select **Finalize Harvest** to commit them to the resolved recipients.

A generated reward is missing or cannot be awarded

Confirm its compendium remains enabled in dnd5e **Configure Sources**. Craftworks validates source availability when generating and again when awarding.

Drakkenheim components are not appearing

- Confirm the **Monsters of Drakkenheim** Content Pack is enabled.
- Confirm the connected account has the corresponding entitlement.
- Confirm the supported official source module is installed and active.
- Run **Sync with Compendiums** after changing content or access.
- Check the Harvest preflight for fallback standard components and any matching warnings.

A recipe reports missing materials

Check the selected **Using Actor Inventory**. A requirement can depend on canonical material identity, quantity, rarity, category, stage, tags, alternatives, or several units of the same material - not only the displayed item name.

Support

Report reproducible problems at [Morelord Craftworks Issues](#). Include Craftworks, Foundry, and dnd5e versions; the active content packs; relevant console errors; and steps to reproduce the problem.

Morelord Craftworks Player Manual

Morelord Craftworks lets you browse your campaign's materials and recipes, plan crafting projects, work from personal or shared inventories, and take part in Harvest and Gather sessions started by your Game Master.

This manual applies to Morelord Craftworks 0.4.4.

Contents

- Before you begin
- Open Craftworks
- Browse materials
- Browse and learn recipes
- Plan and complete crafting
- Participate in Harvest
- Participate in Gather
- Understand awards and storage
- Optional Drakkenheim content
- Troubleshooting

Before you begin

You normally need a character assigned to your Foundry user or an owned character token on the scene. Your GM controls the available Content Packs, recipe knowledge, acquisition settings, and whether acquired materials go to individual characters or a shared party Group actor.

Materials are normal dnd5e loot Items. Their Craftworks identity includes information such as rarity, category, processing stage, tags, and source pack, so a recipe may require more than an item with a similar name.

Open Craftworks

1. Open **Token Controls** on the left side of the scene.
2. Select the **Morelord Craftworks** control.
3. Choose **Materials**, **Recipes**, or **Craft** from the dashboard.

Harvest and Gather windows open automatically when the GM starts a session in which your character can participate. Use **Documentation** at the top of the dashboard for the current in-Foundry guide.

The Craftworks dashboard gives players direct access to Materials, Recipes, and Craft.

Browse materials

Open **Materials** to search the complete active material catalog. A material card can show its name, image, rarity, category, processing stage, value, acquisition methods, tags, and recipes that use it.

Search and filters

Enter part of a name in Search or use facets such as Content Pack, rarity, category, stage, and material tag. Each facet cycles through three states:

Symbol	State	Meaning
Empty circle	Any	Do not filter on this value.
Plus	Include	Require this value.
Minus	Exclude	Hide results with this value.

You can include several useful values while excluding unwanted families. Counts update against the complete catalog as you adjust the context. For responsiveness, Craftworks initially displays up to 300 matching cards even when the total is larger.

Use links between Materials and Recipes to move from an ingredient to recipes that use it or from a recipe requirement back to relevant materials.

The Materials browser combines full-catalog search, tri-state filters, and material details.

Browse and learn recipes

Open **Recipes** to search available projects. Recipe cards can show the output, total crafting duration, required materials, tools, checks, normal and no-tool DCs, and whether your selected inventory currently satisfies each requirement.

Known and Unknown recipes

- **Known** recipes display their ingredient requirements and can begin a new crafting job.
- **Unknown** recipes remain searchable and can be marked as goals, but their ingredients are concealed until the GM marks them Known.

Recipe rarity describes the public recipe or output rarity. It remains visible for an Unknown recipe and does not reveal its ingredient rarity.

Find recipes you can make

The Recipes browser can filter by Content Pack, category, recipe rarity, ingredient rarity, ingredient material tag, knowledge, and inventory craftability. Enable **Only Show Craftable Recipes** to compare requirements with the current **Using Actor Inventory**.

Changing a query or facet updates the prospective count and hides stale results until you run Search again where the interface requests it.

The Recipes browser shows recipe knowledge, requirements, filters, and crafting status.

Mark a goal

Use a recipe's crafting marker to add or remove it from your Craft list. You may mark an Unknown recipe as a future goal even though you cannot see its ingredients or start a new job yet.

Plan and complete crafting

Open **Craft** to see recipes you marked for crafting and any active jobs. The window uses the same two-panel search-and-filter pattern as the reference browsers.

Choose the crafter and inventory

- **Using Crafter Actor** is the character doing the work. This actor supplies tool possession, tool proficiency, and check data.
- **Using Actor Inventory** supplies the ingredients and receives the finished output for that job.

These can be different. For example, your character can make the checks while the party's Group actor supplies shared materials. Changing inventory does not create a separate progress record; progress belongs to the crafter and recipe.

Read requirement status

Each ingredient row shows the amount available and required. Green counts satisfy a requirement; red counts do not. Requirements can identify:

- an exact Craftworks material
- a rarity, category, or processing stage
- one or more material tags
- alternative ingredients
- several units that must come from one matching material

Tool information is shown separately. Craftworks uses the crafter's actual tool possession and proficiency to select the normal DC or the higher no-tool DC.

Make progress

Each crafting attempt represents two hours of work. A successful attempt adds progress. A failed check spends the two hours but does not consume recipe materials. Some recipes define no check and advance through their own supported workflow.

Progress persists between attempts. Recipe cards display the total duration, and the active job records successful progress and total time spent.

Some recipes require a facility supplied by the current Morelord Core Location, such as a forge. A project pauses while that environment is unavailable and resumes when the requirement is met. Crafting projects can also appear in Morelord Downtime and open directly into a focused Craftworks recipe view.

When the job completes, the output is delivered to the selected inventory actor. Foundry Item outputs use their live name and image and can be opened from their linked reference.

If you cancel an active job, Craftworks returns materials consumed when that job began.

Actual crafting execution requires the appropriate premium access. Standard users can still browse, evaluate requirements, mark goals, and review the Craft window.

The Craft workspace brings selected goals, actor context, requirements, and progress together.

Participate in Harvest

Harvest begins when the GM selects defeated creatures and starts a synchronized session.

Roll against the creatures

1. Wait for the Harvest window to open.
2. Choose an available Harvest skill.
3. Select **Roll Harvest Checks**.
4. Craftworks rolls that skill separately against every unresolved creature available to your character.

Each creature uses its own Harvest DC. A success reveals claimable components; a failure consumes your character's attempt for that creature. Previously attempted or resolved creatures are not rolled again.

The GM chooses the characters included in the Harvest and may enable the session-wide **Skip Skill Checks** option. When enabled, every included character proceeds directly to the available choices. If you control multiple included characters, Craftworks opens an independently titled Harvest window for each one; their checks and claims remain separate.

The player Harvest window presents the available skill choices and each unresolved creature.

Claim a component

Select one of the highlighted components after a success. If your natural d20 was 20 and the world setting permits it, you can receive a second claim. Claimed creatures remain expanded to keep the window from shifting during a large Harvest; you can still collapse a creature manually.

A claim is a reservation, not an immediate inventory award. All participants see it in the shared **Claimed Components** list, and another player cannot take the same reserved component. Materials connected to one of your marked recipes may display **Needed for Crafting**.

The GM must select **Finalize Harvest** before reserved items enter their resolved inventories. If the GM resets or cancels the session, unfinalized claims are discarded.

Successful Harvest checks reveal component choices and their source creatures.

A claimed component is visibly reserved while the session awaits GM finalization.

Finalization posts the delivered Harvest materials as linked chat results.

Participate in Gather

Gather is an individual opportunity tied to the current scene and its terrain.

1. Wait for the GM to start Gather.
2. Review the terrain and displayed DC.
3. Choose an allowed Gathering skill.
4. Make the configured dnd5e roll, or decline the opportunity.
5. On a success, Craftworks awards an appropriate material from the active terrain content.

The GM selects participating characters using the same party-priority picker as Harvest. If you own multiple included characters, each receives an independently titled Gather window and a separate scene-tracked attempt.

An attempt is tracked for your character on that scene, so closing and reopening the application does not provide another roll. Your GM can reset the scene's Gather state when a new opportunity is appropriate.

The player Gather window shows the terrain, DC, available skills, and decline option.

ADVANTAGE

NORMAL

DISADVANTAGE

Gather uses the normal dnd5e roll-configuration dialog for the selected skill.

A successful Gather attempt displays the resulting material and outcome.

Understand awards and storage

Your GM can configure acquired Craftworks materials to go directly to participating characters or to a shared dnd5e Group actor. Loot and Hoard awards also let the GM choose a player character or Group actor as recipient.

When Craftworks commits an award, it posts a consolidated public chat card. The card can include the recipient, linked item names, images, rarities, quantities, and currency. Select a linked item to inspect its document.

Harvest is different while it is in progress: a component appears on the final award card only after the GM finalizes the session.

Craftworks award cards summarize delivered items for the recipient.

Optional Drakkenheim content

Your campaign may enable the exceptional **Monsters of Drakkenheim** Content Pack. It is additional content rather than a requirement for using Craftworks.

When available, you may encounter:

- Drakkenheim material families and rarities in the Materials browser
- recipes using setting-specific components
- creature-specific Harvest choices drawn from official Harvestable Components data
- special harvesting instructions presented by the GM

Drakkenheim materials appear as optional, setting-specific families within the normal Materials browser.

Drakkenheim recipes use the same recipe cards, knowledge rules, and crafting workflow as other content.

The normal Craftworks controls do not change. You still search with the same filters, mark recipes in the same way, make Harvest checks against individual creatures, reserve components, and receive them when the GM finalizes the session.

If the pack or its official source content is unavailable, Craftworks can use standard Harvest results where possible. Ask the GM about content access when you expected a setting-specific component but received the standard experience.

Troubleshooting

Craftworks does not show my character

- Select a token for a character you own.
- Ask the GM to assign your Foundry user a character.
- Ask the GM to verify your Owner permission.

A material or recipe is missing

- Clear Search and active filters.

- Ask the GM whether the relevant Content Pack is enabled.
- Ask the GM to confirm the required official source is installed and selected in dnd5e **Configure Sources**.
- Ask the GM to run **Sync with Compendiums**.

A recipe is Unknown

Unknown recipes intentionally conceal ingredients. You can mark one as a goal, but the GM must mark it Known before you can inspect its requirements or start a new job.

Craft says an ingredient is missing

Confirm the correct **Using Actor Inventory** is selected. A visually similar Item may not match the required canonical material, rarity, category, stage, tags, quantity, or same-material rule.

The no-tool DC is being used

The **Using Crafter Actor** must possess the required tool and have the necessary proficiency. Items stored only in the selected inventory actor do not replace the crafter's own tool context.

My Harvest claim is not in inventory

This is expected until the GM selects **Finalize Harvest**. Claims only reserve components during the live session.

Gather says this character already attempted

Gather opportunities are tracked per character and scene. The GM must reset the scene's Gather state before the character can try again.

Getting help

Ask your GM first about enabled content, recipe knowledge, shared storage, and acquisition settings. Reproducible module problems can be reported at [Morelord Craftworks Issues](#).
