Morelord Journeys

Morelord Journeys is a Foundry Virtual Tabletop v14 module for running exploration as a structured, stateful workflow.

It manages route planning, travel-day decisions, progress, supplies, discoveries, and expedition history while leaving consequential choices with the players.

Features

- Nine-phase travel-day workflow with weather, pace, encounters, discovery, navigation, forced march, foraging, camp, and sleep resolution
- Exact one-third-day route progress with pace, delay, navigation, discovery, and forced-march adjustments
- D&D 5e expedition roles and player-side Survival, Perception, encounter, and foraging roll requests
- Expedition-pooled food and water (Pint), plus traveler-owned tents, bedrolls, and blankets
- Persistent camp watch order, private watch rolls, sleep checks, and explicit consequences
- Optional Morelord Encounters and Morelord Craftworks integrations
- Expedition log with phase names and recorded results

Installation

Install using the manifest URL:

<https://raw.githubusercontent.com/tmoreland72/morelord-journeys/main/module.json>

Platform

- Foundry Virtual Tabletop v14 only
- Morelord Core 0.3.6 or later
- D&D 5e adapter first, with a system-neutral journey engine

Development

`npm test`

Release documentation check

Production releases require the `docs` directory in the archive. Before releasing, update the manuals and set `docs/README.md` frontmatter to the target version; the shared release script rejects a missing or mismatched documentation landing page. Review all manuals as part of each code change, including behavior and compatibility requirements.

Morelord Journeys Documentation

Morelord Journeys turns overland travel into a shared expedition workflow. A Game Master defines the route and party, then resolves each travel day through Weather, Pace, Encounters, Discovery, Foraging, Navigation, Press On, and Camp.

Journey distance uses exact thirds of a normal travel day. Routes can begin with fractional lengths, and pace, weather, discoveries, navigation, and forced marches add or remove thirds while the original plan remains visible.

Choose a guide

- Game Master Manual - installation, journey setup, every travel phase, supplies, camp, integrations, and troubleshooting.
- Game Master Travel Rules Reference - draft granular rules for the planned travel-mechanics update.
- Player Guide - responding to roll requests, managing supplies, keeping watch, and understanding expedition results.

These guides describe Morelord Journeys 0.3.3 for Foundry Virtual Tabletop v14 and D&D 5e 5.3 or later.

Morelord Journeys: Game Master Manual

Requirements

- Foundry Virtual Tabletop v14
- D&D 5e system 5.3 or later
- Morelord Core 0.3.6 or later
- GM permission in the world

Morelord Encounters is recommended for encounter construction. Morelord Craftworks is optional and adds Gather and Craft handoffs.

Installation

Install the module using this manifest URL:

<https://raw.githubusercontent.com/tmoreland72/morelord-journeys/main/module.json>

Enable **Morelord Core** and **Morelord Journeys** in the world. Reload the world after installing or updating so Foundry loads the current module JavaScript and socket services.

Opening Journeys

Open the Token scene controls and select the hiking-person button. Opening Journeys refreshes the Supply Manifest from the current party and traveler inventories. The refresh button remains available when inventory changes while the window is already open.

Planning a journey

Enter the journey and route names, origin, destination, planned length, danger, and route DCs.

Route ratings

- **Length** is entered as whole days plus 0, $\frac{1}{3}$, or $\frac{2}{3}$.
- **Danger** modifies d100 encounter results toward or away from major events.
- **Discovery DC** is used by the Observer's Perception check.
- **Resources DC** is used by traveler foraging checks.
- **Navigation DC** is used by the Navigator's Survival check.

Select every traveler participating in the expedition. Assign an Observer and Navigator from the selected travelers. Role changes are remembered automatically and each role is only displayed during the phase where it is needed.

Supply Manifest

The manifest reads the party Group inventory and each selected traveler's inventory.

Recognized supplies are:

- Rations and food items

- Water (Pint), including water (1 Pint) and items with the D&D identifier water-pint
- Tents
- Bedrolls
- Blankets

Waterskins, flasks, and barrels are containers, not water. Put water (Pint) items inside a container and set their quantity to the number of available pints. Consuming water reduces that item quantity directly.

The Supply Manifest summarizes one Water for every four available pints; detailed allocation still uses individual pints. Empty containers contribute zero even when they retain a capacity flag. The manifest appears before beginning a day and again during Foraging, not during unrelated phases.

Food and water form one expedition pool across traveler and Group inventories. Sleeping supplies are not pooled: a traveler may only use tents, bedrolls, and blankets from that traveler's own inventory.

Starting and completing a day

Select **Begin Travel Day** to start the nine-phase cycle. Camp and Sleep & Shelter are separate phases. Journeys calculates movement in thirds. Pace supplies base movement; weather, discoveries, forced marching, and Navigation change the exact distance remaining.

The Expedition Log records phase names and results. The step indicator uses an orange checked circle for every completed phase.

Weather

Weather resolution is required while the Weather phase is enabled.

- Roll the extreme-weather check first; a 1 on 1d20 enables extreme weather.
- Then roll a compatible forecast. An extreme day cannot generate an ordinary clear forecast.
- The override can force an extreme forecast, but it does not replace the initial check.
- Disable the Weather phase in Journeys Settings when weather will be handled entirely outside Journeys.

Cold weather is carried into Camp automatically but can be changed there when local conditions differ.

Pace

Choose Slow ($\frac{2}{3}$ day and foraging advantage), Normal (1 day), Fast ($1\frac{1}{3}$ days, foraging disadvantage, and -5 passive Perception), or Stopped (no movement and advantage on foraging and sleep).

Encounters

Roll one daytime d100 or request it from an active player. The result can be No Encounter, Signs, Minor Encounter, or Major Encounter. Danger and every known route, pace, and weather modifier change the total. Mark **Route traffic** during route creation so Journeys applies the road/high-traffic modifier explicitly.

When a complication occurs, **Open Morelord Encounters** appears as an orange action button. If Morelord Encounters is not installed, Journeys explains how to enable it.

Discovery

The assigned Observer receives a Perception request. The dialog opens automatically on the active owning player's client and returns the result to the GM interface.

Discovery pursuit is inferred from its duration. Enter zero when the clue is ignored; otherwise enter any number of whole days plus zero, one, or two thirds. This supports extended ruins or dungeon expeditions rather than limiting discoveries to one day.

The GM can resolve a pending request automatically when no player is available. Pursuit normally costs $\frac{1}{3}$ day, with GM-selectable whole days and additional thirds and an optional d100 lead prompt.

Foraging

Each traveler makes a Survival check against the route's Resources DC. Player dialogs open on the appropriate clients and report results to the GM.

After all checks resolve:

1. Review the food and water required.
2. Confirm the proposed personal and Group allocations.
3. Consume supplies.
4. Journeys immediately applies water consequences, updates hunger, and sends any required starvation Constitution saves after supplies are confirmed.

Open Morelord Craftworks - Gather is an optional orange action. Gathering crafting materials does not replace Journeys' food and water resolution.

Navigation

The assigned Navigator receives a Survival request against the Navigation DC. Success applies the day's movement, failure by 1-4 applies no progress, and failure by 5 or more adds the day's movement back to distance remaining.

Press On

Pressing on adds $\frac{1}{3}$ day. Every traveler receives a DC 12 Constitution saving throw request; failure adds one Exhaustion.

Camp

Watch Order & Camp Actions

Assign a traveler and camp action to each watch. Assignments save automatically and carry into the following day.

Available camp actions include:

- Take a Watch
- Craft
- Cook

- Prepare
- Slumber
- Task

Selecting Craft displays a GM reminder and an orange **Open Morelord Craftworks - Craft** button.

Rolling a watch

Camp makes one night d100 roll. Danger, weather, and derived camp quality modify the result. A fire is required for Craft, Cook, and Prepare; it indicates excellent setup but also advertises the camp. No fire and no tents indicates poor setup. Assignments save automatically. Anyone not assigned to Take a Watch receives Slumber's rest treatment.

Journeys Settings can disable the nightly d100 independently from Sleep & Shelter. Camp must resolve its enabled nightly check before advancing. Sleep checks and pending Peaceful Rest choices are completed on the following Sleep & Shelter phase.

Sleep & Shelter

Sleep & Shelter is separate from watch planning. Tents, bedrolls, and blankets default from each traveler's own inventory. Prior selections carry into the next day.

- A traveler-owned tent reduces that traveler's sleep DC by 5.
- A bedroll supports one traveler and reduces the sleep DC by 2.
- A blanket supports one traveler and reduces the DC by 1 in cold weather.
- Extreme weather increases the sleep DC by 5.
- A Peaceful Rest night result reduces the sleep DC by 5.

Select **Roll Party Sleep Checks** to roll privately. Cold weather is inherited from the forecast. Sleep begins at eight hours minus two hours for each watch taken. Journeys tracks interruptions in hours; a Night Attack prefills one combat-interruption hour for the affected watcher, while Minor encounters add no interruption unless the GM determines that combat occurred. Six hours of sleep and less than one interrupted hour are required. Player-submitted Peaceful Rest selections are shown to the GM and committed when the phase advances; Journeys does not apply those benefits mechanically. Missed Long Rests use escalating Xanathar-style deprivation saves unless the GM enables **Do not add Exhaustion level for lack of sleep**.

Journey progress

Progress is shown in days and thirds. The daily calculation explains every added or removed third while the original route length remains visible. The journey completes when distance remaining reaches zero.

Troubleshooting

Journeys does not open

Reload the Foundry world after updating. Module JavaScript and socket listeners are loaded during world startup, so closing and reopening only the Journeys window does not load changed code.

Supplies are stale

Reopen Journeys or select the Supply Manifest refresh button. Confirm each traveler still belongs to the expedition and the expected Group actor contains the shared inventory.

Water shows zero

Confirm the actor owns an item named `water (Pint)` or `water (1 Pint)`. A waterskin alone contributes no water. Set the water item's quantity, place it inside the waterskin if desired, then reopen Journeys or refresh the manifest.

A player request does not appear

Confirm the player is active and owns the assigned Actor. Reload both GM and player clients after updating the module so both clients register the same socket service version.

An integration button is unavailable

Confirm the corresponding Morelord module is installed and active. Reload the world after enabling modules so their public APIs are available.

Shared travel context and automatic checks

The GM can select a shared Core Location, set personal activity hours for the travel day, and add temporary capabilities available during the journey. Manage Locations opens Core's shared registry. Temporary capabilities do not permanently change the Location. Optional Downtime integration uses completed days and personal activity hours; Journeys remains usable when Downtime is absent.

A check with an effective DC of zero succeeds automatically without a player roll dialog. Sleep applies equipment modifiers before deciding whether a roll is needed. Automatic success does not waive Long Rest requirements, create extra foraging rewards, or erase ordinary food and water consequences.

Character portraits identify travelers in assignments, checks, supplies, and results. Changing a travel phase returns its page to the top; ordinary updates retain the page position.

Morelord Journeys: Player Guide

Morelord Journeys gives players direct responsibility for the checks their characters make during travel. When the GM requests a check, a dialog opens automatically on the client of the player who owns the assigned character.

Before departure

Keep travel supplies on your character or in the shared party Group inventory.

- Food and water carried by travelers and the Group actor are pooled for the expedition.
- Water is tracked as `water (Pint)` quantity; a Medium traveler needs four pints when no source is found.
- Waterskins and flasks are containers and do not count as water by themselves.
- Tents, bedrolls, and blankets are used during Sleep & Shelter, but only by the traveler who personally owns them.

You may place `water (Pint)` inside a waterskin. Journeys counts the contained water item and consumes its quantity when needed.

Player roll requests

Keep the Foundry world open during the expedition. A request dialog identifies the character, skill, purpose, and DC when applicable.

Select the roll button and complete the normal D&D 5e configuration dialog. The result is posted through D&D 5e and returned to the GM's Journeys interface automatically.

Discovery checks

The Observer rolls Perception to notice discoveries and opportunities along the route. The GM decides whether the party pursues a lead after seeing the result.

Foraging checks

Every traveler may receive a Survival request during Foraging. Success reduces the supplies needed from inventory. The GM resolves allocation and shortages after all travelers respond.

Navigation checks

The Navigator rolls Survival against the route's Navigation DC. The result is recorded in the Expedition Log so the party can see what happened during the day.

Encounter rolls

When player encounter rolling is enabled, Journeys asks one active party owner to make the day's d100 encounter check. Danger and GM-selected situational modifiers determine whether the result is quiet, signs, a minor event, or a major encounter.

Camp watches

Journeys makes one night encounter roll for camp. If it selects your character's watch, a Perception request opens on your client.

Roll Perception to determine whether your character notices a surprise encounter or finds a boon. The total returns to the GM and appears beside that watch.

Your selected camp action may affect how alert the character is:

- **Take a Watch** keeps full attention on the surroundings.
- **Craft, Cook, Prepare**, and most tasks divide attention and impose disadvantage.
- **Slumber** means the character is asleep and automatically fails Perception checks.

Craft, Cook, and Prepare require a campfire. A character who is not assigned to Take a Watch receives the same rest treatment as Slumber.

Follow the GM's instruction about advantage or disadvantage in the D&D 5e roll configuration dialog.

Crafting during camp

If Craft is selected, the GM will tell the assigned player to open Morelord Craftworks and perform a Craft action. Journeys records the camp assignment, while Craftworks resolves the crafting activity.

Sleep and shelter

The GM reviews each traveler's tent, bedroll, and blanket before rolling sleep checks. Your own inventory supplies the default choices.

Sleep checks are private. The GM interface records the result and explains the consequence:

- Safe sleep can reduce Exhaustion when the character was fed and watered.
- Supply shortages can prevent recovery even after a successful check.
- Journeys tracks sleep hours and interruptions. Missing a Long Rest can trigger an escalating Xanathar-style Constitution save against Exhaustion unless the GM disables that consequence.

If a request does not appear

1. Confirm you are logged in and active.
2. Confirm your user owns the assigned character.
3. Ask the GM to resend or reroll the relevant step.
4. Reload the Foundry world if the module was just installed or updated.

Automatic checks and personal activity time

When the effective DC is zero, Journeys resolves the check without opening a player roll dialog. Equipment can reduce the Sleep check to zero, but the character must still meet the Long Rest requirements. Ordinary foraging rewards and food or water consequences continue to apply.

The GM may provide personal activity hours and Location capabilities for the travel day. If Downtime is enabled, eligible Projects can use that travel context; ask the GM which activities are available. Character

portraits help distinguish assignments when you control more than one traveler.

Morelord Journeys: Game Master Travel Rules Reference

GM reference for the travel-rules update introduced in Morelord Journeys 0.3.2.

Journeys measures distance in thirds of a normal travel day. Three thirds equal approximately 24 miles. Pace gives the party its starting movement for the day; weather, discoveries, navigation, and a forced march then change that amount.

Journeys always shows the calculation before changing the route distance. It also retains the route's original planned length, so a detour or mistake never erases the party's original expectation.

When creating a route, enter its length as whole **Days** plus **Additional Thirds** of 0, $\frac{1}{3}$, or $\frac{2}{3}$. For example, 4 days plus $\frac{2}{3}$ is stored and displayed as 4  days. Journeys stores integer thirds internally, so fractional route lengths never depend on decimal rounding.

Preparing a route

Every route has five ratings.

Rating	What it controls
Length	The route's distance in travel days; each day contains three thirds
Danger	How strongly encounter rolls shift toward Major Encounters or Night Attacks
Discovery DC	The Observer's Perception DC for noticing optional leads
Resources DC	Each traveler's Survival DC for finding food and a water source
Navigation DC	The Navigator's Survival DC for making progress without becoming lost

A safe road is normally longer, has low Danger, few discoveries, poor foraging, and easy or automatic navigation. A shortcut may be shorter and rich in resources but more dangerous and difficult to navigate.

The travel day

Journeys uses this order:

1. Weather
2. Pace
3. Day Encounter
4. Discovery
5. Navigation
6. Press On
7. Foraging and Supplies
8. Camp

9. Sleep and Shelter

The GM can disable phases in world settings. Journeys labels disabled phases as skipped in the expedition log. Disabling a phase does not invent a hidden result: for example, disabling Navigation treats it as an automatic success, while disabling Foraging requires the GM to mark food and water manually if those needs remain enabled.

Weather

Weather has two rolls. First, Journeys prompts you to determine whether extreme weather occurs. Roll 1d20; on a 1, the day has extreme weather. Then roll or select a compatible forecast.

An extreme day cannot produce an ordinary forecast such as Clear Skies. Journeys limits the second roll to extreme results:

Spring and summer	Fall and winter
Gale-force winds	Blizzard
Thunderstorm	Freezing rain
Flash flooding	Ice storm
Heat wave	Cold snap

Extreme weather has three automatic effects:

- Subtract one progress third.
- Impose disadvantage on the Navigator's Survival check.
- Add 5 to every sleep DC that night.

You may override either roll when the route or story requires it. Journeys records the rolled result and your final selection.

Pace

Ask the party to choose its pace after seeing the weather.

Stopped

The party gains no route movement. Travelers have advantage on foraging and sleep checks, and the day's encounter Danger is reduced. Journeys does not make a daytime travel encounter check.

Slow

The party gains two progress thirds. Travelers have advantage on foraging checks. When a daytime encounter occurs, the party notices other creatures first and may try to approach stealthily or bypass them.

Normal

The party gains three progress thirds with no additional pace effect.

Fast

The party gains four progress thirds. Travelers have disadvantage on foraging checks. Subtract 5 from the party's highest passive Perception when resolving daytime encounter detection.

Day encounters

Journeys normally makes one encounter check for a day of travel, representing approximately 24-25 miles of exposure. This is not automatically a combat roll.

Modified d100	Result
1-40	No encounter
41-60	Signs and foreshadowing
61-85	Minor encounter: hazard, discovery, or social scene
86+	Major encounter: combat or major story moment

Danger shifts the roll upward:

Danger	Typical region	Modifier
0	Protected or exceptionally quiet	-10
1	Safe or civilized	+0
2	Untamed wilderness	+5
3	Hostile territory	+10
4	Extremely dangerous	+15
5	Lethal or otherworldly	+20

Journeys applies every applicable situational modifier known from the route, pace, and weather:

Situation	Modifier
Road or high traffic	+5
Favorable weather	-5
Bad weather or low visibility	+5
Stealthy travel or strong party awareness	-10

Journeys shows the raw roll, modifiers, modified result, and outcome. You can let a player make the encounter roll when the campaign uses player-facing encounter checks.

Detection and surprise

Journeys displays the party's highest passive Perception. Fast pace reduces that value by 5.

When you construct an encounter in Morelord Encounters, its Stealth action uses the worst Stealth modifier among the chosen creatures. Compare that result with the displayed passive Perception. When the two values are within 5 of each other, neither side is surprised. Journeys records the comparison but does not begin combat automatically.

What the noncombat results mean

- **Signs and foreshadowing** reveal that something is nearby or has passed through: tracks, damage, discarded gear, distant calls, smoke, or frightened travelers.
- **Minor encounters** create a decision without demanding a major battle: a blocked crossing, dangerous terrain, an argument between NPCs, a wounded creature, or a localized magical effect.
- **Major encounters** can be combat, but may instead be a major faction scene, severe hazard, or campaign-changing discovery.

Discoveries

The Observer rolls Wisdom (Perception) against the route's Discovery DC. Success means the Observer notices a lead. Do not reveal the discovery immediately; give the party a clue and let it decide whether to spend time investigating.

Ignoring the clue costs nothing. Any duration greater than zero means the lead was pursued. Enter whole days plus zero, one, or two additional thirds, allowing a discovery to consume anything from one third to a multi-day dungeon expedition.

Use the optional d100 prompt when you need inspiration:

d100	Lead
01-10	Fresh tracks leave the main route
11-20	Smoke, light, or movement is visible in the distance
21-30	An unexplained sound carries across the terrain
31-40	Blood, remains, or abandoned equipment marks a side trail
41-50	An unusual cave, spring, grove, or geological feature appears
51-60	Ruined or worked stone is visible nearby
61-70	Wildlife behaves strangely or gathers around a location
71-80	A camp, banner, message, shrine, or trade marker is found
81-90	Signs warn of a hazard, predator, or approaching disaster
91-100	A magical anomaly alters light, weather, plants, or tracks

Examples of useful discovery leads:

- A line of boot prints suddenly leaves the road without returning.
- Black smoke rises beyond a ridge while the air smells faintly of resin.
- A bell rings at irregular intervals from somewhere below ground.
- A broken wagon wheel bears the crest of a friendly faction.
- Every tree in a small grove leans toward the same moss-covered stone.
- Ravens circle a clearing but refuse to land.
- A fresh trail marker uses a symbol one traveler recognizes from home.
- A stream runs warm despite snow on both banks.
- A rusted sword is embedded point-first in the center of the path.
- A child's handwriting warns travelers not to follow the lights.
- The party finds a campsite whose ashes are cold but whose food is untouched.
- Footprints on the muddy road end in the middle of an open field.

Navigation

The Navigator rolls Wisdom (Survival) against the route's Navigation DC. Extreme weather imposes disadvantage. A reliable map, good directions, or route knowledge may grant advantage.

Result	Route effect
Meets or exceeds the DC	Apply the day's movement
Fails by 1-4	The party becomes lost and makes no route progress
Fails by 5 or more	Turned Around; add one full day to the distance remaining

Example: the party chooses Fast pace for four thirds, pursues a discovery for a cost of one third, and loses another third to weather. Its movement is two thirds. If Navigation succeeds, subtract two thirds from the route. If it becomes Lost, route distance does not change. If it is Turned Around, add one full day to the route.

Press On

After Navigation, the party may travel for two additional hours. Pressing on adds one progress third.

Every traveler makes a DC 12 Constitution saving throw. A failed traveler gains one Exhaustion. Journeys sends each owning player a private roll request and shows you when all results are complete. You can resolve a request for an absent player.

Pressing on is not available while Stopped. The save-request control appears only after the GM selects Press On. Every pending request can be resent or resolved manually by the GM.

Foraging and food

Every traveler rolls Wisdom (Survival) against the route's Resources DC.

- A successful traveler finds a full meal and does not consume a ration.
- A failed traveler consumes one ration from the expedition's pooled food.
- The pool includes recognized food carried by every traveler and the Group actor.
- Journeys shows which items and actors will supply the rations before you confirm consumption.
- If no recognized pooled ration is available, use **Manual Ration** when the party has a valid supply Journeys cannot identify.

Journeys tracks consecutive days without a full meal. A character can go $3 + \text{Constitution modifier}$ days without food. On the next hungry day, the character makes a DC 10 Constitution save, increasing by 5 on each additional consecutive hungry day; failure adds one Exhaustion. Eating a full day's ration resets the counter. These outcomes begin automatically when daily supplies are confirmed.

The Foraging panel shows each traveler's roll, meal status, hunger counter, starvation threshold, supply source, and any pending consequence.

Water

A Medium traveler requires four pints per day. A traveler who receives none of the required daily water automatically gains one Exhaustion that day; no saving throw is made. This consequence is applied as soon as daily supplies are confirmed.

A Medium traveler requires four pints of water per day.

The Supply Manifest displays one **Water** for each complete four-pint daily unit, while allocation details continue to show exact pints.

If any traveler succeeds on the day's foraging check, the party finds a water source. Everyone drinks enough, and everyone may refill recognized water containers. Journeys does not consume carried water in that case.

If nobody finds water, Journeys consumes four pints per traveler from the expedition's pooled water. The pool includes recognized water carried by every traveler and the Group actor. Journeys previews every source before consumption. A waterskin or flask is a container, not water by itself.

A traveler who does not receive four pints gains one Exhaustion automatically. Use **Manual Water** when the party has access to water that is not represented by a recognized Foundry item.

Camp setup

The Camp phase establishes:

- Whether the party lights a fire.
- The watch order.
- Each traveler's camp action.
- Whether the derived setup is poor, ordinary, or excellent.

The following Sleep & Shelter phase handles personal tents, bedrolls, blankets, interruptions, sleep saves, and Peaceful Rest choices.

A campfire is required for Craft, Cook, and Prepare. It makes camp setup excellent (-10) while its visibility adds +5, for a combined -5 night modifier. A camp with neither fire nor any tent is poor (+10). All other camps are ordinary.

Camp actions

Action	Resolution
Take a Watch	Full attention; make night Perception normally if this watch is selected
Craft	Resolve crafting manually or through Craftworks; Perception is at disadvantage
Cook	Resolve verbally; on success may remove one Exhaustion from up to two chosen characters; Perception is at disadvantage
Prepare	Resolve the preparation benefit verbally; Perception is at disadvantage
Slumber	Character sleeps; Perception automatically fails; completing the required sleep may grant a Peaceful Rest choice
Task	Resolve the task verbally; Perception is normally at disadvantage unless the task assists observation

Journeys logs manual benefits but does not automatically apply Prepare, Cook, Slumber, or Peaceful Rest benefits to actors.

Any traveler who is not assigned to **Take a Watch** receives the same rest treatment as Slumber. Watch assignments save automatically; there is no separate Save Watch Order step.

Night encounters

Journeys makes one night encounter roll for the whole camp.

Modified d100	Result
1-30	Peaceful Rest
31-60	Uneventful Night
61-85	Minor encounter: hazard, discovery, or social scene
86+	Night attack; base surprise DC 15

Add the route's Danger modifier and every applicable situational modifier:

Situation	Modifier
Road or high traffic	+5
Favorable weather	-5
Bad weather or low visibility	+5
No fire and no tents	+10
Campfire: excellent setup and visibility	-5 net

If the result produces an encounter, Journeys rolls a die with sides equal to the number of watches. The selected watcher makes an active Perception check, modified by their camp action. Morelord Encounters supplies the opposing Stealth check.

Peaceful Rest

When the night result is Peaceful Rest, each eligible player chooses one benefit:

- Advantage on the first saving throw of the next day.
- Remove one additional level of Exhaustion.
- Gain Heroic Inspiration.

Journeys records the selection but does not apply it mechanically. A character using Slumber can also receive a Peaceful Rest selection after completing the sleep required for a Long Rest.

Sleep and shelter

Every traveler makes a Constitution saving throw to sleep. The base DC is 10.

Modifier	DC change
Tent owned by this traveler	-5
Bedroll owned by this traveler	-2
Blanket owned by this traveler in cold weather	-1
Extreme weather	+5

Sleeping supplies are not pooled. A traveler may use only a tent, bedroll, or blanket in that traveler's own inventory. Equipment owned by another traveler or the Group actor never appears as an option. Even if a tent could physically sleep two creatures, Journeys applies its shelter modifier only to the owner.

Journeys shows the complete calculation before rolling. For example:

Base 10 - Tent 5 - Bedroll 2 + Extreme weather 5 = DC 8

Sleep starts at eight hours minus two hours for each watch taken. Journeys records interruptions in hours. A Night Attack prefills one combat-interruption hour; a Minor encounter adds none unless the GM determines it became combat, after which the GM enters the actual interrupted hours. A Long Rest requires a successful sleep check, at least six hours of sleep, and less than one hour of interruption. Peaceful Rest reduces the sleep DC by 5. A completed Long Rest removes one Exhaustion only when the traveler ate a full meal and drank four pints of water.

When a traveler fails to complete a Long Rest, Journeys uses Xanathar-style sleep deprivation by default: DC 10 Constitution save after the first missed rest, increasing by 5 for each consecutive missed rest. Failure adds one Exhaustion. The world setting **Do not add Exhaustion level for lack of sleep** disables that save and Exhaustion, but the character still receives no Long Rest benefits.

The result records the roll, save modifier, every DC modifier, final DC, food and water status, and Exhaustion change.

Reading the help buttons

Orange question-mark buttons appear beside consequential options. Each help panel explains:

- What Journeys rolls or asks you to decide.
- The exact calculation and result bands.
- Which modifiers are automatic.
- Which values you may override.
- A worked example.
- Whether Journeys applies the result or only records a manual benefit.

Use these panels during play whenever the party asks why a result or DC changed. The same calculation is preserved in the Expedition Log.

What Journeys does not automate

Journeys does not enforce encumbrance, begin combat, apply Peaceful Rest choices, or automatically resolve the narrative effects of Craft, Cook, Prepare, Slumber, and Task. It continues to use the D&D 5e actor's existing Exhaustion value and system-defined Exhaustion effects.

Zero-DC resolution

An effective DC of zero resolves as a success without a player roll request, including Sleep after equipment modifiers. This does not bypass Long Rest eligibility, normal foraging rewards, or supply consequences.
